

BACKLOG

- ☐ Healthcare Appointment Management Platform setup
- ☐ Design REST APIs for appointment system
- ☐ Plan doctor availability tracking
- ☐ Define patient appointment validation logic
- ☐ Plan CI/CD pipeline implementation
- ☐ Setup testing strategy
- ☐ Setup monitoring and logging

FEATURES

- ☐ Appointment API Development
- ☐ Doctor Availability Tracking System
- ☐ Patient Appointment Status System
- ☐ Automated Testing Framework
- ☐ CI/CD Pipeline Setup
- ☐ Repository Management
- ☐ Application Monitoring
- ☐ Build Validation System

USER STORIES

- ☐ Check appointment status

☐ Know doctor availability before booking

☐ Ensure service reliability using health check API

☐ Automated testing to validate API functionality

☐ CI pipeline automation for continuous integration

☐ Version control to manage code changes

☐ Monitoring to track application health

TASKS

☐ Create Flask application

☐ Implement `"/health"` endpoint

☐ Implement `"/"` home endpoint

☐ Implement `"/appointment-status"` endpoint

☐ Implement `"/doctor-availability"` endpoint

☐ Write pytest test cases for all APIs

☐ Create GitHub repository

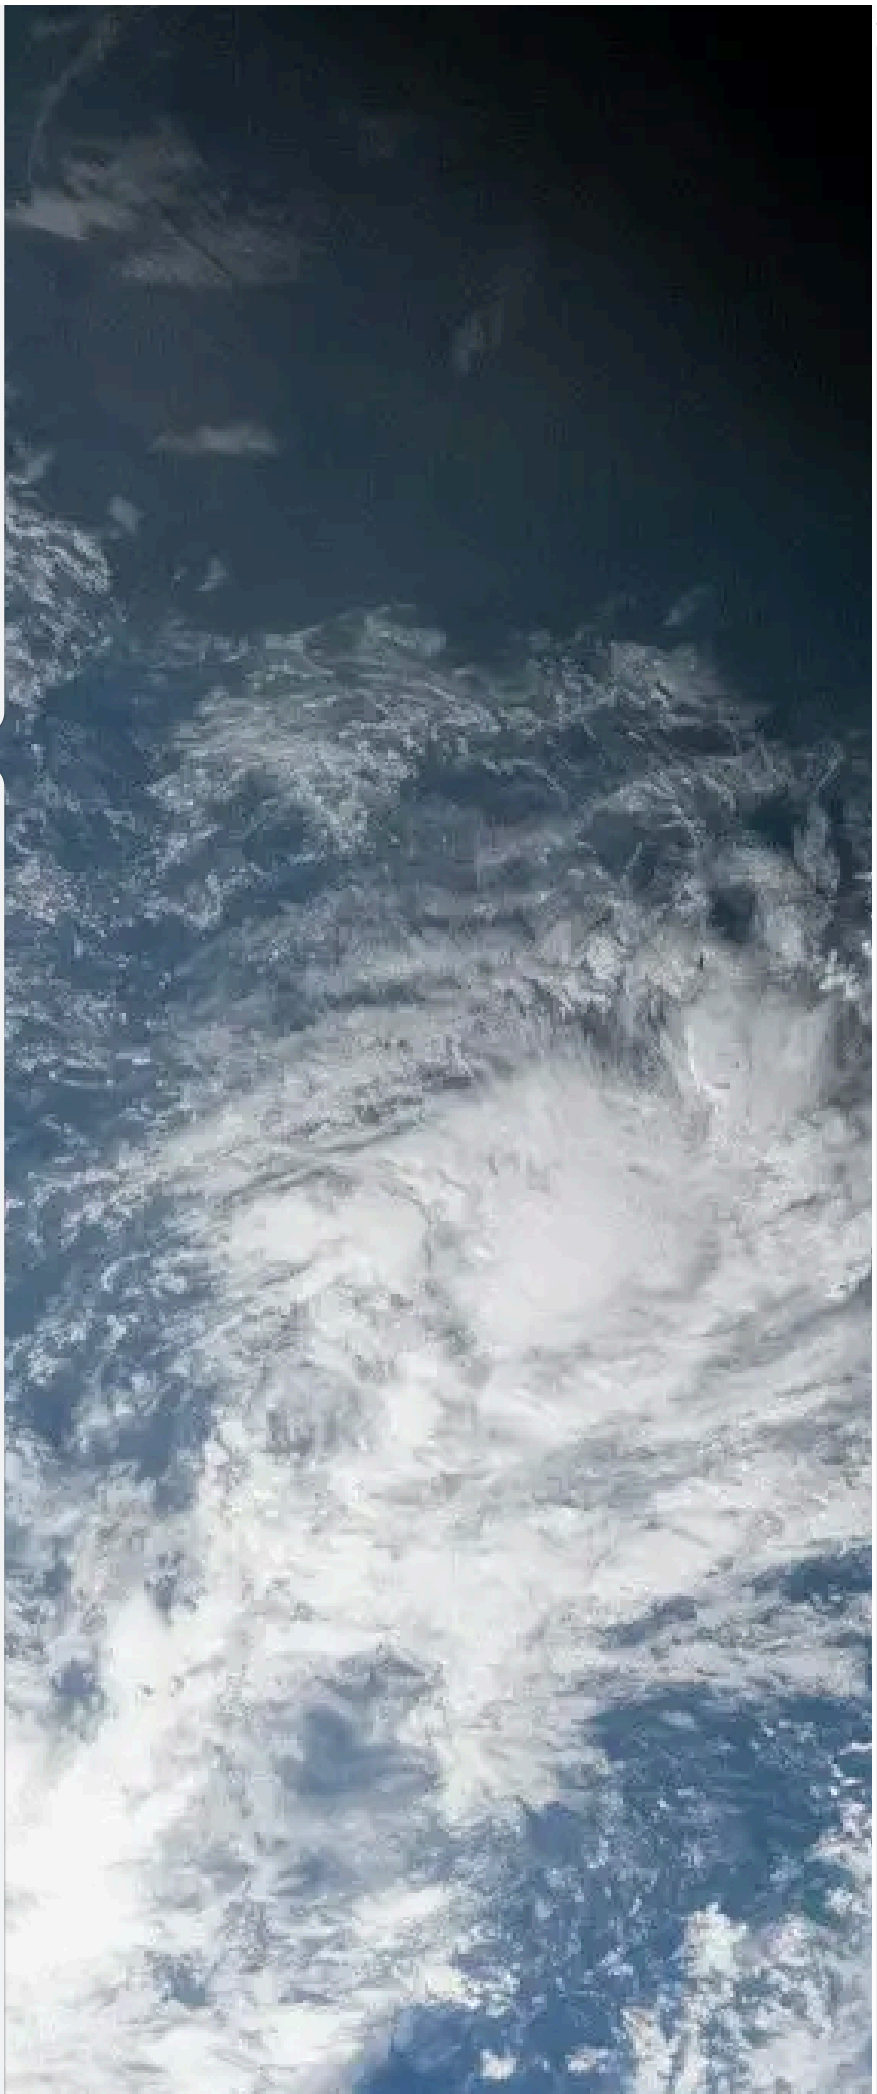

☐ Push code to GitHub

☐ Create `.github/workflows` directory

☐ Add GitHub Actions workflow file

☐ Configure CI pipeline

☐ Run automated tests using pytest

☐ Fix bugs and errors

☐ Validate successful pipeline execution

IN PROGRESS

☐ Implement API endpoints

☐ Write test cases

☐ Setup CI pipeline

COMPLETED

☐ Create Flask application

☐ Setup GitHub repository

☐ Configure CI pipeline
