

Docker commands:

docker run -d -p 8080:8080 --name airflow apache/airflow standalone

docker ps - here you will see the port number

docker logs airflow - here you will see the user name and password note it then click the hamburger sign you will traffic/ports select it then you will see the ports select that port then enter the user name and password you get to see the dashboard.

docker exec -it airflow bash

Give cd dags

cat > first_dag.py - opens a file...then paste the content give enter then give ctrl+D - then give ls-you will see the file listed

Then press exit.

docker restart airflow - after giving this wait for 2 mins...go to that login page and refresh the page..Select the option DAG in the home screen select play button ie is run it

The screenshot shows the Apache Airflow web interface. The left sidebar contains navigation links: Home, Dags, Assets, Browse, Admin, Docs, and User. The top navigation bar has tabs for 'Dags', 'Dag Runs', and 'Task Instances'. Below the tabs is a search bar and a set of filters for dag status: All, Failed, Queued, Running, Success, Required Actions, Active, and Paused. There is also a 'Filter by tag' dropdown. The main content area shows '1 Dag' and a table of dag runs. The first dag is 'first_training_dag' in the 'training' environment. It has a schedule of '0 0 * * *' and a latest run on '2026-05-07 11:29:25' with a success status. The next run is scheduled for '2026-05-08 05:30:00'. The table also shows a 'Schedule' column with a calendar icon and a 'Next Run' column with a play button icon.

Schedule	Latest Run	Next Run
0 0 * * *	2026-05-07 11:29:25	2026-05-08 05:30:00

This is what signifies that the dag has been created successfully.
